

# EduSphere

## Platform Overview

Prepared for Faculty of Economics and Business Administration (FSEG) approval · English edition · 6 August 2026

University-verified student access

No student file numbers stored

Private staff-only course books

Database-enforced access controls

## 1 Purpose

EduSphere is a verified academic portal for FSEG students, faculty, the Student Council, and administration. It brings academic records, private files, requests, review workflows, and oversight into one controlled service rather than relying on informal messaging groups and unverified shared drives.

The platform is designed so that access follows an academic need: students receive their own schedules and enrolled-course material; doctors work only with their confirmed teaching assignments; the Student Council operates the archive, printing and review functions; and administration retains accountable oversight.

This edition records the course-book workflow and the privacy statement requested for faculty approval.

## 2 Features by Role

Each role has a distinct, intentionally limited workspace.

### Students

- University-record verification before student access is granted.
- Personal timetable, enrolled courses, assignments, and permitted resources.
- Past-exam archive with quality reporting and controlled downloads.

### Doctors / Faculty

- Materials, assignments, exam submissions, and print requests for assigned teaching work.
- Independent review of each council course-book proposal.
- Private replacement upload where a proposed book is incorrect.

### Student Council

- Private print desk, archive management, events, and exam-review queues.
- Upload course books, review doctor replacements, manage exact instructor aliases, and monitor print counts.
- Visible unresolved-instructor counts so no students are silently omitted.

### Administration and Owner

- Oversight across operational workspaces and a permanent privileged-action audit trail.
- Role administration, controlled access to private files, and accountable intervention when needed.

### 3 Course-Book Review and Print Planning

A course can have multiple books. The operational decision is attached to the doctor's specific teaching assignment, not to the course globally.

|                                          |                                                                                                                                                                                                                           |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1. Council proposal</b>               | The Student Council uploads a PDF or PowerPoint course book for a course. The file is private and is offered only to doctors assigned to teach that course.                                                               |
| <b>2. Independent doctor review</b>      | Each assigned doctor confirms the proposal for their own teaching assignment or rejects it. Dr. A's decision does not decide for Dr. B, even when both teach the same course.                                             |
| <b>3. Private replacement</b>            | A rejecting doctor may upload a replacement PDF or PowerPoint with a reason. That replacement is visible only to that doctor, the Student Council, administration, and the owner; other doctors cannot open or select it. |
| <b>4. Council approval and selection</b> | The council reviews the replacement. Once confirmed, that doctor selects the book for the relevant teaching assignment. Only a confirmed decision for that exact assignment can affect print planning.                    |

- Teaching assignments come from university schedule records after an exact, staff-maintained instructor-alias match. Doctors cannot declare themselves responsible for an arbitrary course.
- Students inherit the selected book through their scheduled doctor. If a lecture and TD have different doctors and different selected books, the print view intentionally counts the student under both selections rather than guessing a tie-breaker.
- The council sees unresolved instructor records separately. These students are flagged as unattributed, never silently dropped from a print count.

### 4 Student File Number: No Storage Guarantee

The following is precise. It is not a claim that EduSphere stores no data at all.

**A student's university file number is used only in memory for one university-verification or schedule-refresh request. It is never written to EduSphere's database, never logged, never sent to telemetry, and is discarded when that request ends.**

Derived academic information needed to operate the service—such as a verified student profile, timetable, enrolment, and teaching allocation—may be retained. The platform also has error and usage telemetry as described in its privacy notice. Those facts do not alter the file-number guarantee: the file number itself is not retained anywhere.

## 5 Security Measures

Security is applied at the database and storage layers, rather than being dependent on hidden interface buttons.

### Role and row-level access control

The database checks every protected read and write against the caller's role and relationship to the data. A page-level mistake cannot by itself make the database return an unauthorised record.

### Private files and short-lived links

Exam papers, course material, submissions, print documents, and course books are private objects. A fresh signed link is issued only after the current access rule succeeds and expires shortly afterward.

### Course-book isolation

The course-book workflow records a decision per teaching assignment. Direct record edits are not a workflow path. Doctor replacements are restricted to the submitting doctor and authorised staff.

### Server-mediated book upload

The browser has no direct course-book upload permission. The upload service authenticates the caller, enforces a 150 MB limit, checks PDF or PowerPoint file signatures, stores an unguessable object name, and removes the object if the workflow registration fails.

### Authoritative teaching scope

Resolved university schedule records—not a doctor's self-declared course list—create teaching assignments. This prevents a doctor from granting themselves access to another course's students, books, or counts.

### Auditability

Privileged workflow changes are recorded in an append-only audit trail. The operational record is preserved for oversight rather than replaced by an untraceable edit.

### Encrypted transport and authentication

Browser, database, storage, and university-verification connections use encrypted HTTPS. Review accounts use passwordless one-time sign-in; student verification remains tied to the real university API.

## 6 Release and Governance

The temporary review deployment uses one managed Supabase project and passwordless role accounts for doctor, Student Council, administrator, and—when the university API is available—student review.

- Before any cloud migration, the existing project is backed up because legacy bookstore tables are intentionally removed by the ordered migration sequence.
- The release includes a disposable-environment migration and role/access test gate before the production review database is changed.
- The student review account deliberately remains tied to real university verification; no bypass or stored file-number substitute is introduced for the temporary review.
- Reviewer inboxes and the verified SMTP sending domain are configured by the faculty-controlled administrator and are never stored in this document or source repository.

### Approval scope

EduSphere provides the features and safeguards described in this document. Go-live activation remains conditional on the faculty-controlled backup, migration validation, email configuration, and role smoke tests in the release runbook.

EduSphere is designed to make academic operations more dependable without asking students or faculty to trust an invisible process. The essential controls—academic scope, private files, role boundaries, per-doctor review, and an auditable record—are explicit and inspectable.
